

RA 253 MA® is a fully austenitic, cerium-bearing heat resistant alloy. Matching weld fillers are designed to deposit approximately 4-10 FN to assure a sound, crack-free weld deposit.

**SMAW** Shielded Metal Arc Welding RA 253 MA AC/DC titania electrodes, UNS W30816, may be used with either alternating current or with direct current, reverse polarity (electrode positive). The presence of cerium in RA 253 MA electrodes gives the weld bead a somewhat rougher appearance as compared with ordinary stainless welds.

It is important to maintain the arc length as short as possible, as it minimizes loss of cerium through the arc and improves penetration. Starts and craters should be filled in. Stringer beads with only a slight weave, not more than twice the electrode diameter are preferred. Weaving is necessary for vertical welds. All welding flux must be removed from each deposit, between passes and after the final pass. Residual welding flux may corrode the material when placed in high temperature service.

Typical SMAW Parameters (The lower end of the range is used for out-of-positioning welding)

Suggested Current Ranges - At 24-30 Volt			
Inch	3/32	1/8	5/32
Amperes	45-70	70-110	100-140

RA 253 MA electrodes are packaged in hermetically sealed containers to assure freedom from contamination and moisture absorption. After opening, the electrodes should be stored at 150- 250°F to prevent the coating from absorbing moisture. Electrodes damaged by exposure to atmospheric humidity should be reconditioned for two to four hours at 500-600°F. It is important to heat and cool slowly. Porosity and excessive spatter may result if electrodes are not completely dry.

FCAW Flux Cored Wire

## **SAW** Submerged Arc Welding

Intended for service up to 2000°F. Neither preheat or post weld treatment is necessary. Unused wire should be stored in a moisture resistant environment. Starting welding parameters for flat/horizontal position: 100-200 amps, 25-35 volts. Suggestions for welding:

Shielding Gas: 75% Argon 25% CO<sub>2</sub>

Gas Flow Rate: 40 ft³/hour

Wire Extension: 1/2" - 1"

RA 253 MA is sub-arc welded using the neutral basic Avesta Flux 805, basicity index 1.7. This is an agglomerate type welding flux characterized by neat deposit surfaces, a smooth transition zone between parent and weld metal, easy slag removal and excellent resistance to moisture absorption during storage.

Correct joint geometry must be used to avoid hot cracking in sub-arc welding. This means that the width of the joint must be greater than the depth. Width should be about 2-3 times depth. Also, interpass temperature should be kept well below 200°F. For all welding processes make stringer beads, do not weave. Do not preheat, except as necessary to ensure the metal is dry.

## **Typical SAW Parameters**

Wire Diameter, in	Direct Current Reverse Polarity, Amperes	Volts	Wire Stickout, in	Travel Speed, in/min
0.062	160-210	29	3/4	8-12
0.094	180-240	27-32	1	16-24
0.125	240-320	30-32	1	16-24
